nystatin - neomycin sulfate - thiostrepton - triamcinolone acetonide ointment

For use in Dogs and Cats Only

DESCRIPTION: Animax Ointment combines nystatin, neomycin sulfate, thiostrepton and triamcinolone acetonide in a non-irritating mineral oil and silicone base.

The preparation is intended for local therapy in a variety of cutaneous disorders of dogs and cats; it is especially useful in disorders caused, complicated, or threatened by bacterial and/or candidal (monilial) infection.

INDICATIONS: Animax Ointment is particularly useful in the treatment of acute and chronic cutis of varied etiologies, in interdigital cysts in cats and dogs, and in anal gland infections in dogs.

SAP and SGPT (ALT) enzyme elevations, polydipsia and polyuria, vomiting, and diarrhea (occasionally bloody) may result in inhibition of endogenous steroid production following drug withdrawal.

SIDE EFFECTS: Acute and/or chronic ototoxicity may occur. If hearing or vestibular dysfunction is suspected,Animax Ointment is not intended for the treatment of deep abscesses or deep-seated infections. The occurrence of systemic reactions is rarely a problem with topical application. Therapy should be observed closely for signs such as polydipsia, polyuria, and increased weight gain.

Gastrointestinal effects, including vomiting and diarrhea, have been observed following parenteral or systemic use of synthetic corticosteroids in dogs. Cushing's syndrome in dogs has been reported in association with prolonged or repeated steroid therapy in dogs. Other Dermatologic Disorders

Animax Ointment combines nystatin, neomycin, thiostrepton and triamcinolone acetonide. It is fungistatic in vitro against a variety of yeast and yeast-like fungi including many fungal pathogens to animals. Acneprable activity is exhibited against bacteria. Thiostrepton has a high order of activity against gram-positive organisms, including many which are resistant to other antibiotics; neomycin exerts antimicrobial action against a wide range of gram-positive and gram-negative bacteria. Together they provide comprehensive therapy against those organisms responsible for most superficial bacterial infections.

WARNINGS: By virtue of its four active ingredients, Animax Ointment provides four basic therapeutic effects: anti-inflammatory, antipruritic, antifungal and antibacterial. Triamcinolone acetonide is a potent synthetic corticosteroid providing rapid and prolonged anti-inflammatory and anti-pruritic relief on topical application. Nystatin, neomycin, and thiostrepton provide bacteriostatic, antifungal and antibacterial activity. The four ingredients work in concert to provide therapy against those organisms responsible for most superficial bacterial infections.

CAUTION: Federal law restricts this drug to use by or on the order of a licensed veterinarian.

For Topical use on Dogs and Cats Only

DESCRIPTION: Animax Cream combines nystatin, neomycin sulfate, thiostrepton and triamcinolone acetonide.

The preparation is intended for local therapy in a variety of cutaneous disorders of dogs and cats; it is especially useful in disorders caused, complicated, or threatened by bacterial and/or candidal (monilial) infection.

INDICATIONS: Animax Cream (Nystatin-Neomycin Sulfate-Thiostrepton-Triamcinolone Acetonide Cream USP) is indicated in the management of dermatologic disorders in dogs and cats, characterized by inflammation and dry or exudative dermatitis, particularly those caused, complicated, or threatened by bacterial or candidal (Candida albicans) infections. It is also of value in eczematous dermatitis, contact dermatitis, and seborrheic dermatitis; and as an adjunct in the treatment of dermatitis due to parasitic infestation.

PRECAUTIONS: Animax Cream is not intended for the treatment of deep abrasions or deep-seated infections such as inflammation of the lymphatic vessels. Parenteral antibiotic therapy is indicated in these infections.

Avoid ingestion. Oral or parenteral use of corticosteroids (depending on dose, duration of use, and specific steroid) may result in inhibition of endogenous steroid production following drug withdrawal.
